# Homework - 17 Aug

Extend the CRUD app with the following:

1. Add an API for retrieving all items that belong to a particular user id.

2. Modify the PUT /items API to restrict updating of the item by its user only.
   a. For example: item id 2 belongs to user id 3
   b. PUT /items/2 can only be called successfully by user id 3
   c. All other users should be forbidden from accessing the API

*You may choose to store the objects in memory without persisting to a database. The focus of the homework is on the API design, implementation and error handling.*
